Recommended actuator

Lastenheft zur Größenbestimmung und Gefahrenanalyse

Performance specification for determining sizes and hazard analysis

Doppelte Kraftanbindung

Die Last wird an beiden Wellenenden unterstützt.

Doppelte Kraftanbindung

Die Last wird an beiden Wellenenden unterstützt. Der obere Teil der Halterung wird auf den Wellenflansch geschraubt, der untere Teil ist mit einer Zugstange durch die Wellenbohrung gesichert.

STRADDLE MOUNTING

The load is supported at both ends of the shaft. The upper portion of the bracket is bolted to the shaft flange, the lower portion is secured by a tie rod passed to the shaft bore.

Der Hersteller empfiehlt bei Sicherheitsbezogenen Anwendungen die doppelte Kraftanbindung.

For safety related applications dual mounting is recommended by manufacturer.

Straddle mounting

The load is supported at both ends of the shaft.

Einfache Kraftanbindung

Die Last wird nur an einem Ende der Welle am Wellenflansch verschraubt.

Zuganker Ja/Nein
Tie rod yes/no

Einfache Kraftanbindung

Die Last wird nur an einem Ende der Welle am Wellenflansch verschraubt.

CANTILEVER MOUNTING

The load is bolt mounted to the shaft flange and only supported at one end of the shaft

Bei kritischen Anwendungen wird die einfache Kraftanbindung nicht empfohlen.

For critical applications single mounting is not recommended.

Cantilever mounting

The load is mounted to only one end of the shaft.

Functional description

The oil pressure supplied via connections P1 or P2 generates a rotary movement on the actuator flange (F) (Fig.1). Here the linear movement of the piston is converted by helical gear running in opposite directions on the housing, piston and shaft to a rotary movement.

Direction of rotation

Due to the admission of pressure in P1 the actuator flange (F), with shaft rotates to the left from the initial position, see Fig.2 (counter-clockwise when viewed in the direction of the actuator flange). A change of direction of rotation is possible as a special version. All mobile rotary actuators are delivered in the front end position.

Angle of rotation

The actuators in the M-DA-H series are available with a standard angle of rotation of 180° and 360°. In addition to the standard angle of rotation, any additional angle of rotation is available.

Pressures, seals and temperatures

The M-DA-H series is designed for a maximum working pressure of 210 bars. Mineral oils to ISO-VG-46 are recommended. The actuators with standard seals should be operated within the temperature range of -18°C to +70°C. Please consult the factory if they are to operate at higher or lower thermal loads.

The advantages of the M-DA-H series

- No internal leakage
- Precise positioning without deviation
- Any intermediate angle of rotation possible
- Direct securing of load on one or both sides
- Through shaft hole
- High bearing load capacity
- Harmonic design
- Compact solution
- Use of high quality, high strength materials
- Sealing material from reputable manufacturers

Special requirements can be met wherever possible.

Technical data type M-DA-H 50 180°

Order no.: 200518009917

Angle of rotation		180°
Nominal torque	Nm	190
Max. working pressure	bar	210
Weight	kg	~7,4
Absorption volume	dm ³	0,073
You will find further technical data on the next page		

Cycle times

In regular rotary movement the cycle times should be no faster than 5 seconds for a rotary movement of 180° and 10 seconds for one of 360°. The values indicated are effective values and lower values are not permitted. In a multi-shift operation and where the continuous stresses are very high, we recommend considering a safety factor of 70% of the maximum permissible torque.

General characteristics

The rotary actuators in the M-DA-H series are designed principally for the mobile range. Based on the helical gear technique, a compact solution has been produced for a max. working pressure of 210 bars and a torque of up to 2900 Nm. The harmonic design and compact structure complete the overall image on a positive note. Rotary movements are possible in both directions. The use of high quality materials guarantees extremely long service life. In the actuator there is a drilled hole for cables and pipes, but alternatively this hole may be used for a tie rod for transferring high bending moments.

Typical applications

The applications range from automotive engineering, working platforms and control of construction machinery through fire fighting working baskets to concrete conveyor belts etc. You may obtain information on further possible applications from the manufacturer.

The actuators in the M-DA-H series are available with a standard angle of rotation of 180° and 360°. In addition to the standard angle of rotation, any additional angle of rotation is available.

Pressures, seals and temperatures

The M-DA-H series is designed for a maximum working pressure of 210 bars. Mineral oils to ISO-VG-46 are recommended. The actuators with standard seals should be operated within the temperature range of -18°C to +70°C. Please consult the factory if they are to operate at higher or lower thermal loads.

The advantages of the M-DA-H series

- No internal leakage
- Precise positioning without deviation
- Any intermediate angle of rotation possible
- Direct securing of load on one or both sides
- Through shaft hole
- High bearing load capacity
- Harmonic design
- Compact solution
- Use of high quality, high strength materials
- Sealing material from reputable manufacturers

Special requirements can be met wherever possible.

Technical data type M-DA-H 80 360°

Order no.: 200836009896

Angle of rotation		360°
Nominal torque	Nm	1073
Max. working pressure	bar	210
Weight	kg	~36
Absorption volume	dm ³	0,712
You will find further technical data on the next page		

Cycle times

In regular rotary movement the cycle times should be no faster than 5 seconds for a rotary movement of 180° and 10 seconds for one of 360°. The values indicated are effective values and lower values are not permitted. In a multi-shift operation and where the continuous stresses are very high, we recommend considering a safety factor of 70% of the maximum permissible torque.

General characteristics

The rotary actuators in the M-DA-H series are designed principally for the mobile range. Based on the helical gear technique, a compact solution has been produced for a max. working pressure of 210 bars and a torque of up to 2900 Nm. The harmonic design and compact structure complete the overall image on a positive note. Rotary movements are possible in both directions. The use of high quality materials guarantees extremely long service life. In the actuator there is a drilled hole for cables and pipes, but alternatively this hole may be used for a tie rod for transferring high bending moments.

Typical applications

The applications range from automotive engineering, working platforms and control of construction machinery through fire fighting working baskets to concrete conveyor belts etc. You may obtain information on further possible applications from the manufacturer.

For swelling load only! (where the load varies consult the manufacturer!) Tie rods may be supplied as optional extras by agreement.

Functional description

The oil pressure supplied via connections P1 or P2 generates a rotary movement on the actuator flange (F) (Fig.1). Here the linear movement of the piston is converted by helical gear running in opposite directions on the housing, piston and shaft to a rotary movement.

Direction of rotation

Due to the admission of pressure in P1 the actuator flange (F), with shaft rotates to the left from the initial position, see Fig.2 (counter-clockwise when viewed in the direction of the actuator flange). A change of direction of rotation is possible as a special version. All mobile rotary actuators are delivered in the front end position.

Angle of rotation

The actuators in the M-DA-H series are available with a standard angle of rotation of 180° and 360°. In addition to the standard angle of rotation, any additional angle of rotation is available.

Pressures, seals and temperatures

The M-DA-H series is designed for a maximum working pressure of 210 bars. Mineral oils to ISO-VG-46 are recommended. The actuators with standard seals should be operated within the temperature range of -18°C to +70°C. Please consult the factory if they are to operate at higher or lower thermal loads.

The advantages of the M-DA-H series
